creating the perfect bite.

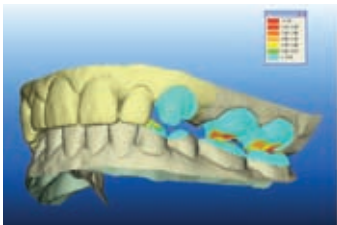

No More Goop, Gagging, or Discomfort — the iTero Solution

Using iTero™, your dentist can take a highly accurate digital impression for your crown or bridge area, completely eliminating the uncomfortable tray and putty impression. What's more, iTero technology all but guarantees a perfect fit for your new crown or bridge, so you spend less time at the dentist's office and more time enjoying your new smile!

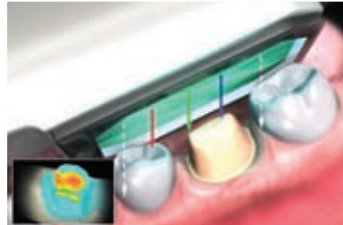

THE SCAN

You and your dentist can follow the progress of the scan on the computer screen.

THE WAND

Your dentist uses iTero to capture images of the tooth surfaces and the gum tissues.

THE 3D MODEL

The completed scan is sent to the computer, which builds a three-dimensional model of your teeth.

Some of the benefits you can expect with an iTero impression:

COMFORT: If you have ever had a conventional impression taken, you know just how uncomfortable the process is. The putty is messy, tastes extremely unpleasant, and in many patients can cause gagging. With iTero, the only thing that touches your teeth is the tip of a hand-held wand.

GREATER SPEED: The digital impression is complete in approximately three to five minutes.

REDUCED ANXIETY: The scanner is a compact, hand-held wand. Once your dentist begins the scanning process, it can be stopped and started as many times as necessary. You'll never be stuck with a mouth full of goop!

ACCURACY: The iTero digital impression system creates an exact replica of what is in your mouth. This results in a more accurate-fitting crown or bridge.
